

Save the Pangolins

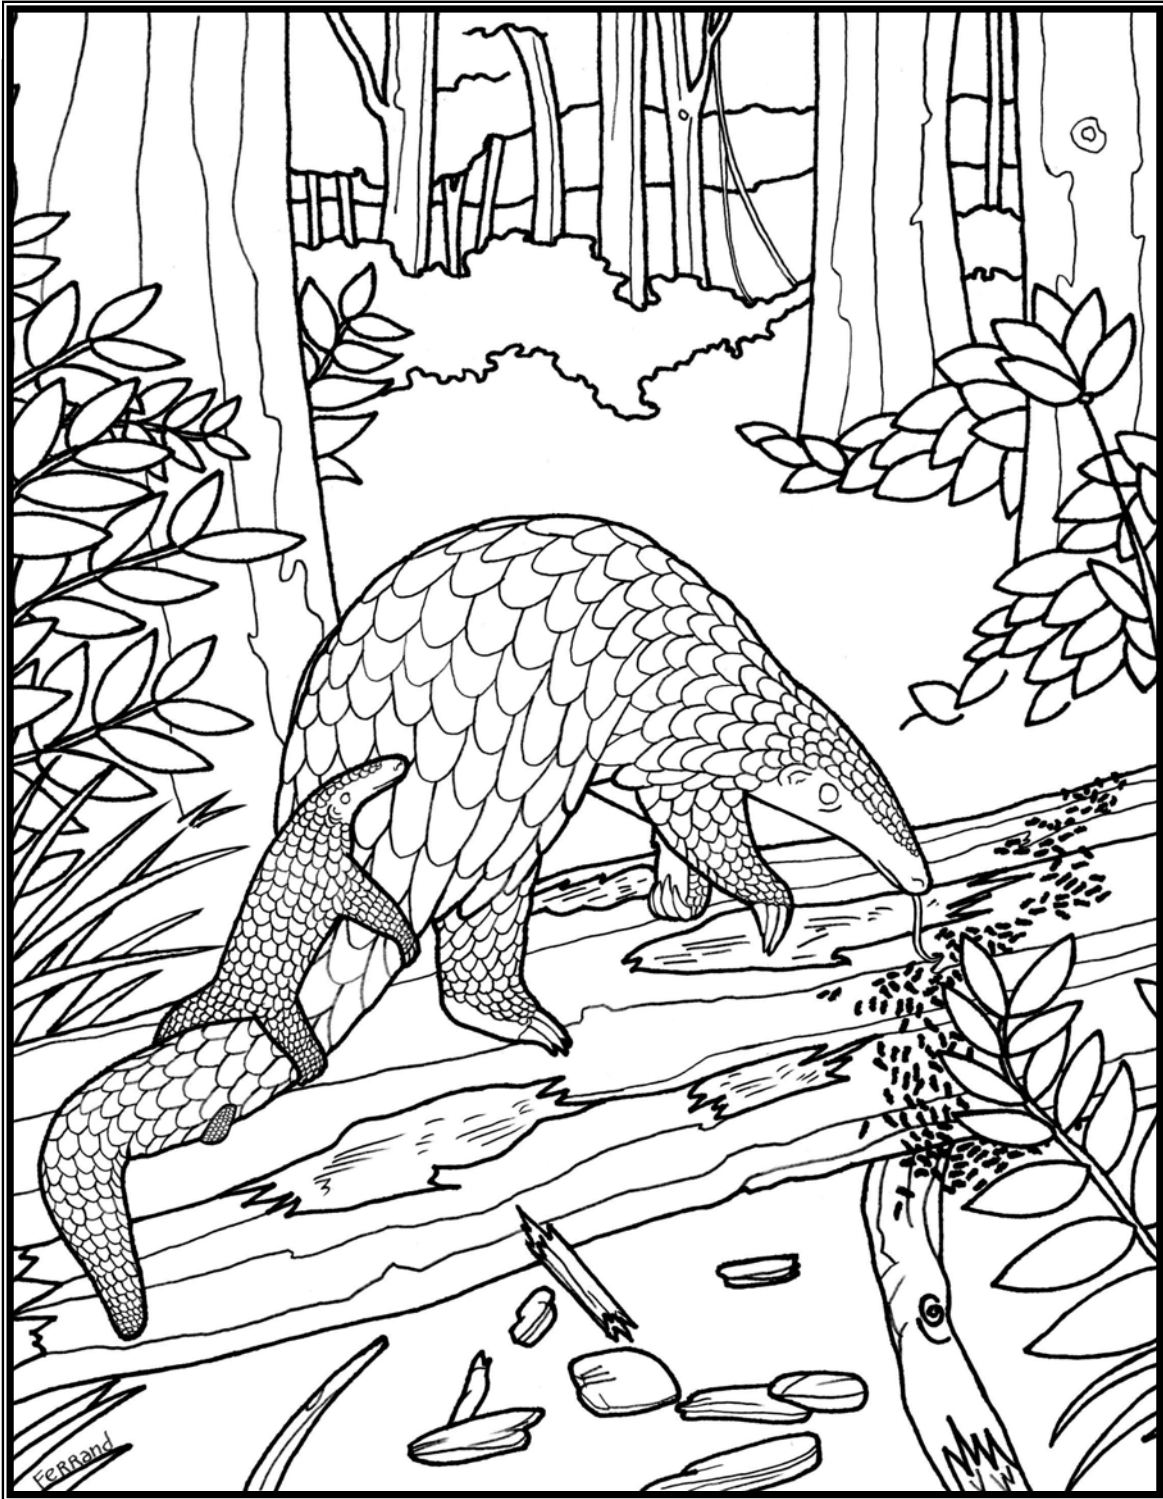

Illustration © 2008 Gregory Ferrand (gferrand.com)

A pangolin baby clings to her mother's tail as she searches for insects.

Pangolins are nocturnal mammals that are covered in hard scales. They live in forests and clearings in Asia and sub-Saharan Africa, and eat ants and termites with their long and sticky tongues. A single pangolin can eat 70 million insects in one year! Pangolins are rare animals that are threatened by habitat loss and illegal hunting and trading.
